# Acid Rain

## ACID RAIN

Acid rain is the rain that is formed by the burning of fossil fuels. Nitrogen and sulfur gases emerge from fossil fuels, such as coal and oil, which are burned especially where industrial activities and energy consumption are high. These gases enter the reaction with the water vapor in the clouds to reveal nitric acids and these acids fall to earth as a result of natural weather or snow, rain, hail and the use of water formed under conditions such as the formation of rain. This is called acid rain.
